Compressible flow (or gas dynamics) is the branch of fluid mechanics that deals with flows having significant changes in fluid density. While all flows are compressible, flows are usually treated as being incompressible when the Mach number (the ratio of the speed of the flow to the speed of sound) is less than 0.3 (since the density change due to velocity is about 5% in that case).

One-dimensional inviscid gas dynamics computations are made using a new method to solve the Boltzmann equation. The numerical method is explicit and is based on concepts from the kinetic theory of gases. The gas density, velocity and temperature are computed by integrating numerically the molecular velocity distribution function.

Eto sterilization dynamics is generally considered to be complicated when one attempts to calculate the gas/vapor concentrations in a loaded chamber using the ideal-gas law 11 Variations in load elements, such as in packaging and raw materials, may alter the process behavior. This can present uncertainties in the calculation.
