Overview Of

Cellular respiration is a process that all living things use to convert glucose into energy.

Autotrophs (like plants) produce glucose during photosynthesis.

Heterotrophs (like humans) ingest other living things to obtain glucose. While the process can seem complex, this page takes you through the key elements of each part of cellular respiration.

Overview Of

Cellular Respiration Study

Cellular respiration is a set of metabolic reactions and processes that take place in the cells of organisms to convert biochemical energy from nutrients into ATP, and then release waste products. The reactions involved in respiration are catabolic reactions, which break large molecules into smaller ones, releasing energy in the process.
